Emergent abilities of large language models: GPT (2018)

Let's revisit the Generative Pretrained Transformer (GPT) models from OpenAI as an example:

GPT (117M parameters; [Radford et al., 2018](#))

- Transformer decoder with 12 layers.
- Trained on BooksCorpus: over 7000 unique books (4.6GB text).

Showed that language modeling at scale can be an effective pretraining technique for downstream tasks like natural language inference.

entailment
└──────────┘

[START] *The man is in the doorway* [DELIM] *The person is near the door* [EXTRACT]

Emergent abilities of large language models: GPT-2 (2019)

Let's revisit the Generative Pretrained Transformer (GPT) models from OpenAI as an example:

GPT-2 (1.5B parameters; [Radford et al., 2019](#))

- Same architecture as GPT, just bigger (117M -> 1.5B)
- But trained on **much more data**: 4GB -> 40GB of internet text data (WebText)
 - Scrape links posted on Reddit w/ at least 3 upvotes (rough proxy of human quality)

Language Models are Unsupervised Multitask Learners

Alec Radford *¹ Jeffrey Wu *¹ Rewon Child¹ David Luan¹ Dario Amodei **¹ Ilya Sutskever **¹

Emergent zero-shot learning

One key emergent ability in GPT-2 is **zero-shot learning**: the ability to do many tasks with **no examples**, and **no gradient updates**, by simply:

- Specifying the right sequence prediction problem (e.g. question answering):

Passage: Tom Brady... Q: Where was Tom Brady born? A: ...

- Comparing probabilities of sequences (e.g. Winograd Schema Challenge [[Levesque, 2011](#)]):

The cat couldn't fit into the hat because it was too big.
Does it = the cat or the hat?

\equiv Is $P(\dots\text{because } \mathbf{the\ cat} \text{ was too big}) \geq$
 $P(\dots\text{because } \mathbf{the\ hat} \text{ was too big})?$

[[Radford et al., 2019](#)]

Emergent zero-shot learning

You can get interesting zero-shot behavior if you're creative enough with how you specify your task!

Summarization on CNN/DailyMail dataset [[See et al., 2017](#)]:

		ROUGE			
		R-1	R-2	R-L	
SAN FRANCISCO, California (CNN) -- A magnitude 4.2 earthquake shook the San Francisco ... overturn unstable objects.	2018 SoTA Supervised (287K) TL;DR: Select from article	Bottom-Up Sum Lede-3 Seq2Seq + Attn GPT-2 TL;DR: Random-3	41.22 40.38 31.33 29.34 28.78	18.68 17.66 11.81 8.27 8.63	38.34 36.62 28.83 26.58 25.52

“Too Long, Didn’t Read”
“Prompting”?

[[Radford et al., 2019](#)]

Emergent abilities of large language models: GPT-3 (2020)

GPT-3 (175B parameters; [Brown et al., 2020](#))

- Another increase in size (1.5B -> **175B**)
- and data (40GB -> **over 600GB**)

Language Models are Few-Shot Learners

Tom B. Brown*

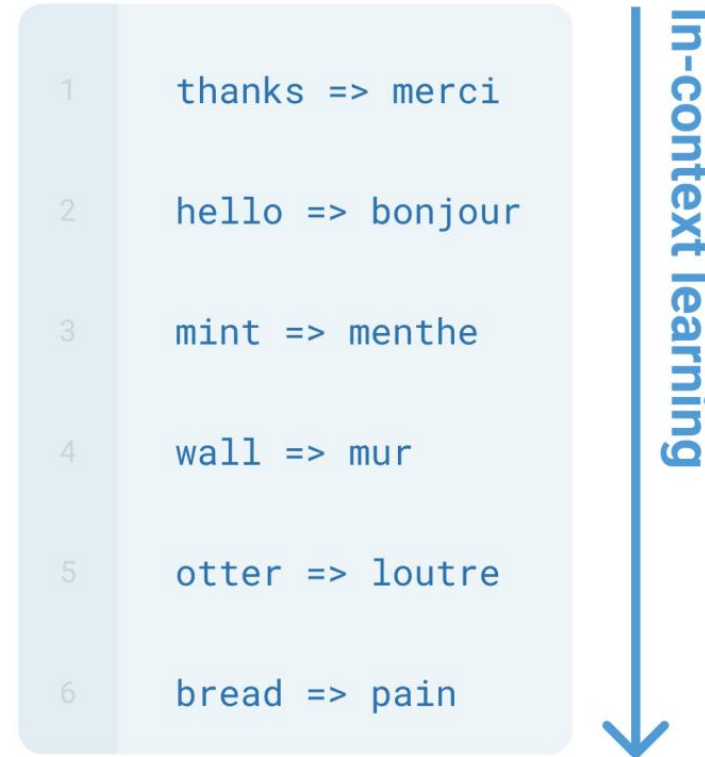

Benjamin Mann*

Nick Ryder*

Melanie Subbiah*

Emergent few-shot learning

- Specify a task by simply **prepending examples of the task before your example**
- Also called **in-context learning**, to stress that *no gradient updates* are performed when learning a new task (there is a separate literature on few-shot learning with gradient updates)

Emergent few-shot learning

Zero-shot

```
1 Translate English to French:
2 cheese => .....
```

Emergent few-shot learning

One-shot

1 Translate English to French: ←
2 sea otter => loutre de mer ←
3 cheese => ←
.....

Emergent few-shot learning

Few-shot

1 Translate English to French:
2 sea otter => loutre de mer
3 peppermint => menthe poivrée
4 plush girafe => girafe peluche
5 cheese =>

Few-shot learning is an emergent property of model scale

Synthetic “word unscrambling” tasks, 100-shot

Cycle letters:

pleap ->
apple

Random insertion:

a.p!p/l!e ->
apple

Reversed words:

elppa ->
apple

[Brown et al., 2020]

New methods of “prompting” LMs

Zero/few-shot prompting

```
1 Translate English to French: ←  
2 sea otter => loutre de mer ←  
3 peppermint => menthe poivrée ←  
4 plush girafe => girafe peluche ←  
5 cheese => ..... ←
```

Traditional fine-tuning

Limits of prompting for harder tasks?

Some tasks seem too hard for even large LMs to learn through prompting alone.

Especially tasks involving **richer, multi-step reasoning**.

(Humans struggle at these tasks too!)

$$19583 + 29534 = 49117$$

$$98394 + 49384 = 147778$$

$$29382 + 12347 = 41729$$

$$93847 + 39299 = ?$$

Solution: change the prompt!

Chain-of-thought prompting

Standard Prompting

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model Output

A: The answer is 27. ❌

Chain-of-Thought Prompting

Model Input

Q: Roger has 5 tennis balls. He buys 2 more cans of tennis balls. Each can has 3 tennis balls. How many tennis balls does he have now?

A: Roger started with 5 balls. 2 cans of 3 tennis balls each is 6 tennis balls. $5 + 6 = 11$. The answer is 11.

Q: The cafeteria had 23 apples. If they used 20 to make lunch and bought 6 more, how many apples do they have?

Model Output

A: The cafeteria had 23 apples originally. They used 20 to make lunch. So they had $23 - 20 = 3$. They bought 6 more apples, so they have $3 + 6 = 9$. The answer is 9. ✓

[[Wei et al., 2022](#); also see [Nye et al., 2021](#)]

Chain-of-thought prompting is an emergent property of model scale

Chain-of-thought prompting

Model Input

Language modeling \neq assisting users

PROMPT *Explain the moon landing to a 6 year old in a few sentences.*

COMPLETION

GPT-3

Explain the theory of gravity to a 6 year old.

Explain the theory of relativity to a 6 year old in a few sentences.

Explain the big bang theory to a 6 year old.

Explain evolution to a 6 year old.

Language models are not *aligned* with user intent [[Ouyang et al., 2022](#)].

Language modeling \neq assisting users

PROMPT *Explain the moon landing to a 6 year old in a few sentences.*

COMPLETION **Human**

A giant rocket ship blasted off from Earth carrying astronauts to the moon. The astronauts landed their spaceship on the moon and walked around exploring the lunar surface. Then they returned safely back to Earth, bringing home moon rocks to show everyone.

Language models are not *aligned* with user intent [[Ouyang et al., 2022](#)].
Finetuning to the rescue!

Recall From Lecture 10: The Pretraining / Finetuning Paradigm

Pretraining can improve NLP applications by serving as parameter initialization.

Step 1: Pretrain (on language modeling)

Lots of text; learn general things!

Step 2: Finetune (on your task)

Not many labels; adapt to the task!

Scaling up finetuning

Pretraining can improve NLP applications by serving as parameter initialization.

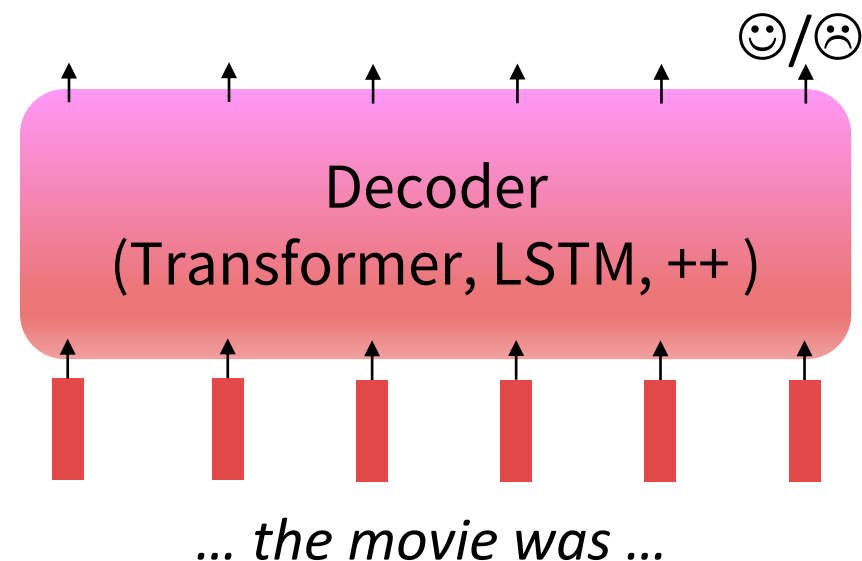

Step 1: Pretrain (on language modeling)

Lots of text; learn general things!

Step 2: Finetune (on **many tasks**)

Not many labels; adapt to the tasks!

Instruction finetuning

- **Collect examples** of (instruction, output) pairs across many tasks and finetune an LM

- Evaluate on **unseen tasks**

Q: Can Geoffrey Hinton have a conversation with George Washington?
Give the rationale before answering.

Geoffrey Hinton is a British-Canadian computer scientist born in 1947. George Washington died in 1799. Thus, they could not have had a conversation together. So the answer is "no".

Instruction ~~finetuning~~ pretraining?

- As is usually the case, **data + model scale** is key for this to work!
- For example, the **Super-NaturalInstructions** dataset contains **over 1.6K tasks, 3M+** examples
 - Classification, sequence tagging, rewriting, translation, QA...
- **Q:** how do we evaluate such a model?

Instruction finetuning

Model input (Disambiguation QA)

Q: In the following sentences, explain the antecedent of the pronoun (which thing the pronoun refers to), or state that it is ambiguous.

Sentence: The reporter and the chef will discuss their favorite dishes.

Options:

- (A) They will discuss the reporter's favorite dishes
- (B) They will discuss the chef's favorite dishes
- (C) Ambiguous

A: Let's think step by step.

Before instruction finetuning

The reporter and the chef will discuss their favorite dishes.

The reporter and the chef will discuss the reporter's favorite dishes.

The reporter and the chef will discuss the chef's favorite dishes.

The reporter and the chef will discuss the reporter's and the chef's favorite dishes.

✘ (doesn't answer question)

Highly recommend trying FLAN-T5 out to get a sense of its capabilities:

[Chung et al., 2022]

Lecture Plan: From Language Models to Assistants

1. Zero-Shot (ZS) and Few-Shot (FS) In-Context Learning

- + No finetuning needed, prompt engineering (e.g. CoT) can improve performance
- Limits to what you can fit in context
- Complex tasks will probably need gradient steps

2. Instruction finetuning

- + Simple and straightforward, generalize to unseen tasks
- ?
- ?

3. Reinforcement Learning from Human Feedback (RLHF)

4. What's next?

Limitations of instruction finetuning?

- One limitation of instruction finetuning is obvious: it's **expensive** to collect ground-truth data for tasks.
- But there are other, subtler limitations too. Can you think of any?
- **Problem 1:** tasks like open-ended creative generation have no right answer.
 - *Write me a story about a dog and her pet grasshopper.*
- **Problem 2:** language modeling penalizes all token-level mistakes equally, but some errors are worse than others.
- Even with instruction finetuning, there a mismatch between the LM objective and the objective of “satisfy human preferences”!
- Can we **explicitly attempt to satisfy human preferences?**

Lecture Plan: From Language Models to Assistants

1. Zero-Shot (ZS) and Few-Shot (FS) In-Context Learning

- + No finetuning needed, prompt engineering (e.g. CoT) can improve performance
- Limits to what you can fit in context
- Complex tasks will probably need gradient steps

2. Instruction finetuning

- + Simple and straightforward, generalize to unseen tasks
- Collecting demonstrations for so many tasks is expensive
- Mismatch between LM objective and human preferences

3. Reinforcement Learning from Human Feedback (RLHF)

4. What's next?

Lecture Plan: From Language Models to Assistants

1. Zero-Shot (ZS) and Few-Shot (FS) In-Context Learning

- + No finetuning needed, prompt engineering (e.g. CoT) can improve performance
- Limits to what you can fit in context
- Complex tasks will probably need gradient steps

2. Instruction finetuning

- + Simple and straightforward, generalize to unseen tasks
- Collecting demonstrations for so many tasks is expensive
- Mismatch between LM objective and human preferences

3. Reinforcement Learning from Human Feedback (RLHF)

4. What's next?

Optimizing for human preferences

- Let's say we were training a language model on some task (e.g. summarization).
- For each LM sample s , imagine we had a way to obtain a *human reward* of that summary: $R(s) \in \mathbb{R}$, higher is better.

wildfires.

$$s_2 \\ R(s_2) = 1.2$$

- Now we want to maximize the expected reward of samples from our LM:

$$\mathbb{E}_{\hat{s} \sim p_{\theta}(s)} [R(\hat{s})]$$

Note: for mathematical simplicity
we're assuming only one "prompt"

Reinforcement learning to the rescue

- The field of **reinforcement learning (RL)** has studied these (and related) problems for many years now [[Williams, 1992](#); [Sutton and Barto, 1998](#)]
- Circa 2013: resurgence of interest in RL applied to deep learning, game-playing [[Mnih et al., 2013](#)]
- But the interest in applying RL to modern LMs is an even newer phenomenon [[Ziegler et al., 2019](#); [Stiennon et al., 2020](#); [Ouyang et al., 2022](#)]. **Why?**
 - RL w/ LMs has commonly been viewed as very hard to get right (still is!)
 - Newer advances in RL algorithms that work for large neural models, including language models (e.g. PPO; [[Schulman et al., 2017](#)])

Optimizing for human preferences

- How do we actually change our LM parameters θ to maximize this?

$$\mathbb{E}_{\hat{s} \sim p_{\theta}(s)} [R(\hat{s})]$$

- Let's try doing gradient ascent!

$$\theta_{t+1} := \theta_t + \alpha \nabla_{\theta_t} \mathbb{E}_{\hat{s} \sim p_{\theta_t}(s)} [R(\hat{s})]$$

How do we estimate
this expectation??

What if our reward
function is non-
differentiable??

- **Policy gradient** methods in RL (e.g., REINFORCE; [[Williams, 1992](#)]) give us tools for estimating and optimizing this objective.
- We'll describe a *very high-level mathematical* overview of the simplest policy gradient estimator, but a full treatment of RL is outside the scope of this course. (Try CS234!)

A (very!) brief introduction to policy gradient/REINFORCE [Williams, 1992]

- We want to obtain (defn. of expectation) (linearity of gradient)

$$\nabla_{\theta} \mathbb{E}_{\hat{s} \sim p_{\theta}(s)} [R(\hat{s})] = \nabla_{\theta} \sum_s R(s) p_{\theta}(s) = \sum_s R(s) \nabla_{\theta} p_{\theta}(s)$$

- Here we'll use a very handy trick known as the **log-derivative trick**. Let's try taking the gradient of $\log p_{\theta}(s)$

$$\nabla_{\theta} \log p_{\theta}(s) = \frac{1}{p_{\theta}(s)} \nabla_{\theta} p_{\theta}(s) \quad \Rightarrow \quad \nabla_{\theta} p_{\theta}(s) = \nabla_{\theta} \log p_{\theta}(s) p_{\theta}(s)$$

(chain rule)

This is an expectation of this

- Plug back in:

$$\sum_s R(s) \nabla_{\theta} p_{\theta}(s) = \sum_s p_{\theta}(s) R(s) \nabla_{\theta} \log p_{\theta}(s)$$

$$= \mathbb{E}_{\hat{s} \sim p_{\theta}(s)} [R(\hat{s}) \nabla_{\theta} \log p_{\theta}(\hat{s})]$$

A (very!) brief introduction to policy gradient/REINFORCE [Williams, 1992]

- Now we have put the gradient “inside” the expectation, we can approximate this objective with Monte Carlo samples:

$$\nabla_{\theta} \mathbb{E}_{\hat{s} \sim p_{\theta}(s)} [R(\hat{s})] = \mathbb{E}_{\hat{s} \sim p_{\theta}(s)} [R(\hat{s}) \nabla_{\theta} \log p_{\theta}(\hat{s})] \approx \frac{1}{m} \sum_{i=1}^m R(s_i) \nabla_{\theta} \log p_{\theta}(s_i)$$

This is why it’s called “**reinforcement learning**”: we **reinforce** good actions, increasing the chance they happen again.

- Giving us the update rule: $\theta_{t+1} := \theta_t + \alpha \frac{1}{m} \sum_{i=1}^m R(s_i) \nabla_{\theta_t} \log p_{\theta_t}(s_i)$

This is **heavily simplified!** There is a *lot* more needed to do RL w/ LMs. **Can you see any problems with this objective?**

If R is +++

Take gradient steps to maximize $p_{\theta}(s_i)$

If R is ---

Take steps to minimize $p_{\theta}(s_i)$

How do we model human preferences?

- Awesome: now for any **arbitrary, non-differentiable reward function** $R(s)$, we can train our language model to maximize expected reward.
- Not so fast! (Why not?)
- **Problem 1:** human-in-the-loop is expensive!
 - **Solution:** instead of directly asking humans for preferences, **model their preferences** as a separate (NLP) problem! [[Knox and Stone, 2009](#)]

An earthquake hit San Francisco. There was minor property damage, but no injuries.

$$R(s_1) = 8.0$$

The Bay Area has good weather but is prone to earthquakes and wildfires.

$$R(s_2) = 1.2$$

Train an LM $RM_\phi(s)$ to predict human preferences from an annotated dataset, then optimize for RM_ϕ instead.

How do we model human preferences?

- **Problem 2:** human judgments are noisy and miscalibrated!
- **Solution:** instead of asking for direct ratings, ask for **pairwise comparisons**, which can be more reliable [[Phelps et al., 2015](#); [Clark et al., 2018](#)]

A 4.2 magnitude
earthquake hit
San Francisco,
resulting in
massive damage.

$$R(s_3) = \begin{matrix} s_3 \\ 4.1? & 6.6? & 3.2? \end{matrix}$$

How do we model human preferences?

- **Problem 2:** human judgments are noisy and miscalibrated!
- **Solution:** instead of asking for direct ratings, ask for **pairwise comparisons**, which can be more reliable [[Phelps et al., 2015](#); [Clark et al., 2018](#)]

An earthquake hit San Francisco. There was minor property damage, but no injuries.

>

A 4.2 magnitude earthquake hit San Francisco, resulting in massive damage.

>

The Bay Area has good weather but is prone to earthquakes and wildfires.

S_3

Bradley-Terry [1952] paired comparison model

$$J_{RM}(\phi) = -\mathbb{E}_{(s^w, s^l) \sim D} [\log \sigma(RM_\phi(s^w) - RM_\phi(s^l))]$$

“winning”
sample

“losing”
sample

s^w should score higher than s^l

Make sure your reward model works first!

Evaluate RM on predicting outcome of held-out human judgments

Large enough RM trained on enough data approaching single human perf

RLHF: Putting it all together [Christiano et al., 2017; Stiennon et al., 2020]

- Finally, we have everything we need:
 - A pretrained (possibly instruction-finetuned) LM $p^{PT}(s)$
 - A reward model $RM_\phi(s)$ that produces scalar rewards for LM outputs, trained on a dataset of human comparisons
 - A method for optimizing LM parameters towards an arbitrary reward function.
- Now to do RLHF:
 - Initialize a copy of the model $p_\theta^{RL}(s)$, with parameters θ we would like to optimize
 - Optimize the following reward with RL:

$$R(s) = RM_\phi(s) - \beta \log \left(\frac{p_\theta^{RL}(s)}{p^{PT}(s)} \right) \quad \text{Pay a price when } p_\theta^{RL}(s) > p^{PT}(s)$$

This is a penalty which prevents us from diverging too far from the pretrained model. In expectation, it is known as the **Kullback-Leibler (KL) divergence** between $p_\theta^{RL}(s)$ and $p^{PT}(s)$.

RLHF provides gains over pretraining + finetuning

InstructGPT: scaling up RLHF to tens of thousands of tasks

30k tasks!

Step 1

Collect demonstration data, and train a supervised policy.

A prompt is sampled from our prompt dataset.

Explain the moon landing to a 6 year old

A labeler demonstrates the desired output behavior.

Some people went to the moon...

This data is used to fine-tune GPT-3 with supervised learning.

SFT

Step 2

Collect comparison data, and train a reward model.

A prompt and several model outputs are sampled.

Explain the moon landing to a 6 year old

A Explain gravity... B Explain war...
C Moon is natural satellite of... D People went to the moon...

A labeler ranks the outputs from best to worst.

D > C > A = B

This data is used to train our reward model.

RM
D > C > A = B

Step 3

Optimize a policy against the reward model using reinforcement learning.

A new prompt is sampled from the dataset.

Write a story about frogs

The policy generates an output.

PPO
Once upon a time...

The reward model calculates a reward for the output.

RM

The reward is used to update the policy using PPO.

[Ouyang et al., 2022]

InstructGPT: scaling up RLHF to tens of thousands of tasks

Tasks collected from labelers:

- **Plain:** We simply ask the labelers to come up with an arbitrary task, while ensuring the tasks had sufficient diversity.
- **Few-shot:** We ask the labelers to come up with an instruction, and multiple query/response pairs for that instruction.
- **User-based:** We had a number of use-cases stated in waitlist applications to the OpenAI API. We asked labelers to come up with prompts corresponding to these use cases.

Use-case	Prompt
Brainstorming	List five ideas for how to regain enthusiasm for my career
Generation	Write a short story where a bear goes to the beach, makes friends with a seal, and then returns home.

InstructGPT

PROMPT

Explain the moon landing to a 6 year old in a few sentences.

COMPLETION

GPT-3

Explain the theory of gravity to a 6 year old.

Explain the theory of relativity to a 6 year old in a few sentences.

Explain the big bang theory to a 6 year old.

Explain evolution to a 6 year old.

InstructGPT

People went to the moon, and they took pictures of what they saw, and sent them back to the earth so we could all see them.

InstructGPT

PROMPT *Write a short poem about a wise frog.*

COMPLETION

GPT-3

Write a short story in which a character has two different names.

Write a short story in which you try to get something back that you have lost.

Write a short story in which a character has a bad dream.

InstructGPT

The frog is a symbol of wisdom
He knows all the secrets of the world
He is a master of disguise
And a great teacher of life
He is a symbol of transformation
And the bringer of change
He is the frog who has seen it all
And knows the meaning of it all

ChatGPT: Instruction Finetuning + RLHF for dialog agents

ChatGPT: Optimizing Language Models for Dialogue

Note: OpenAI (and similar companies) are keeping more details secret about ChatGPT training (including data, training parameters, model size)—perhaps to keep a competitive edge...

Methods

We trained this model using Reinforcement Learning from Human Feedback (RLHF), using the same methods as InstructGPT, but with slight differences in the data collection setup. We trained an initial model using supervised fine-tuning: human AI trainers provided conversations in which they played both sides—the user and an AI assistant. We gave the trainers access to model-written suggestions to help them compose their responses. We mixed this new dialogue dataset with the InstructGPT dataset, which we transformed into a dialogue format.

(Instruction finetuning!)

ChatGPT: Instruction Finetuning + RLHF for dialog agents

ChatGPT: Optimizing Language Models for Dialogue

Note: OpenAI (and similar companies) are keeping more details secret about ChatGPT training (including data, training parameters, model size)—perhaps to keep a competitive edge...

Methods

To create a reward model for reinforcement learning, we needed to collect comparison data, which consisted of two or more model responses ranked by quality. To collect this data, we took conversations that AI trainers had with the chatbot. We randomly selected a model-written message, sampled several alternative completions, and had AI trainers rank them. Using these reward models, we can fine-tune the model using Proximal Policy Optimization. We performed several iterations of this process.

(RLHF!)

ChatGPT: Instruction Finetuning + RLHF for dialog agents

MU

Explain in a few sentences what methods were used in training ChatGPT to the audience of CS224n, Stanford's Deep Learning for Natural Language processing course. A lot of the students are very Gen Z, so be sure to use a ton of emojis to seem hip and cool.

Hey CS224n peeps! 😎 ChatGPT here to spill the tea on how I was trained to be a savvy language model! 🧐

So basically, I was pre-trained using a combination of unsupervised learning techniques, specifically a transformer-based language model architecture, that allowed me to learn patterns and relationships within large amounts of text data. 🤖📖

The training data came from various sources such as books, articles, and websites, and I was fine-tuned on a variety of downstream NLP tasks, which involved supervised learning using labeled datasets to further improve my performance. 🏆

Lecture Plan: From Language Models to Assistants

1. Zero-Shot (ZS) and Few-Shot (FS) In-Context Learning

- + No finetuning needed, prompt engineering (e.g. CoT) can improve performance
- Limits to what you can fit in context
- Complex tasks will probably need gradient steps

2. Instruction finetuning

- + Simple and straightforward, generalize to unseen tasks
- Collecting demonstrations for so many tasks is expensive
- Mismatch between LM objective and human preferences

3. Reinforcement Learning from Human Feedback (RLHF)

- + Directly model preferences (cf. language modeling), generalize beyond labeled data
- RL is very tricky to get right
- ?

4. What's next?

Limitations of RL + Reward Modeling

- Human preferences are unreliable!
 - "Reward hacking" is a common problem in RL

<https://openai.com/blog/faulty-reward-functions/>

Limitations of RL + Reward Modeling

- Human preferences are unreliable!
 - "Reward hacking" is a common problem in RL
 - Chatbots are rewarded to produce responses that *seem* authoritative and helpful, *regardless of truth*
 - This can result in making up facts + hallucinations

 - "Reward hacking" is a common problem in RL
 - Chatbots are rewarded to produce responses that *seem* authoritative and helpful, *regardless of truth*
 - This can result in making up facts + hallucinations
- **Models** of human preferences are *even more* unreliable!
- There is a real concern of AI mis(alignment)!

Percy Liang
@percyliang

RL from human feedback seems to be the main tool for alignment. Given reward hacking and the falliability of humans, this strategy seems bound to produce agents that merely appear to be aligned, but are bad/wrong in subtle, inconspicuous ways. Is anyone else worried about this?

10:55 PM · Dec 6, 2022
