# Spectrophotometer

• Use to quantify the amount of molecules in a liquid sample (solution).

• Measure the amount of light that can pass through a solution

## Process

 Spectrophotometer shines a light on the sample & molecules in the sample interact with the light.

<u>Measure</u>

- Transmittance:
- Absorbance:
- Usually compared to a standard of known concentration

# Visible Spectrum

- Use "White" light
- Prism adjusted to position a specific visible wavelength to interact with the sample

- Measures the amount of light being passed through the sample at that wavelength
  - Absorbance is based on a calculation

#### This diagram is a representation of the inside of a Spectronic 20<sup>™</sup>

Molecules are whatever color of light that they transmit and do not absorb.

### Copper II Sulfate Pentahydrate CuSO<sub>4</sub> 5H<sub>2</sub>O

# **Copper Sulfate**

- Blue sample:
  - When white light shows on a blue molecule all wavelengths are absorbed except the blue wavelength
  - The blue wavelength passes through the sample & so it is detected
    - By our eyes or by the instrument
- Set measurement to 590 nm

#### Light spectrum of colors visible by unaided human eye.

		visible	visible	visable	visible	visible	visible	visible
	Ultra Violet	Violet	Indigo	Blue	Green	Yellow	Orange	Red
(λ Range)	190-400	400- 460	460- 475	475- 490	490- 565	565- 575	575- 600	600- 800
(Avg. λ)	295	430	467.5	482.5	527.5	570	587.5	700

## **Dilution Factor**

• Original Solution to Diluted Solution 1: 10 = 1 to 10 dilution

- Combine 1 volume of original solution + 9 volumes of the solvent
- 1 + 9 = 10 dilution factor

### Serial Dilution Example 2:

• 3 steps with each step at 1: 10 dilution
